7-2 Project

Gianna Screen

Southern New Hampshire University

CS-360

In preparation for the launch of the Inventory App, it's important to think about how the app will roll out in terms of structure and marketing. One of the biggest pieces is how the app will appear in the App Store. This means creating a visually compelling layout with a simple title, strong images, and a clear description that tells users exactly what the app does.

While the app is not fully developed, it is far enough along to launch. Using images of the primary screens will give users an early sense of what to expect and help them understand the primary features.

With the app's current status, it makes the most sense to market it as Version 1.0 and clearly note in the description that new updates and improvements are coming soon. A simple and effective description could look like this:

The Inventory App is a simple, easy-to-use tool designed to help users track and manage any type of inventory. After creating an account with unique credentials, users can log in and begin adding items, deleting items, and editing quantities as needed. The app also supports SMS notifications for important updates, such as low inventory alerts, so users always know when it's time to restock. Version 1.0 includes the primary features needed to get started, with additional enhancements and new tools coming soon.
